FUNDING DETAILS

Emissions Reduction and Sequestration (ERASE) FEED Study

Carbon sequestration from oil and gas operations is needed to help transition our energy systems towards a low carbon future. Currently, carbon dioxide sequestration is allowed in suitable reservoirs below 1000m depth in Alberta. The safe use of suitable reservoirs that are less than 1000m depth and in close proximity to the oilsands operators will enable greater capture and likely more efficient sequestration from the oilsands, reducing the need for long pipelines to transport captured CO2 to other reservoirs in the province.

In this project, MEG Energy will examine the feasibility of shallow aquifer CO2 sequestration near one of its operations in the oilsands region. The project will conduct the appropriate geological and engineering studies to determine the ability of this reservoir to be used for CO2 sequestration. The project results will support additional efforts in the region to reduce CO2 footprints, and inform carbon sequestration regulation in the province.

MEG Christina Lake Regional Project area with several potential pilot locations identified and net thickness of McMurray aquifer

End: 4-6

APPLICATION

Carbon capture and sequestration (CCS) is an effective way to reduce the carbon footprint of energy use. The receiving reservoirs have contained methane and oil for millions of years, and over time the CO2 will mineralize to form carbonate rock ensuring permanent storage. Sequestration enables the oil and gas producers to reduce their carbon footprint to meet low carbon standards and regulations. Shallow CO2 sequestration can be a cost-effective method for oilsands operators to reduce their carbon footprint.

CCUS/Novel Metals and Materials

PROJECT GOALS

- Commercial-scale geoscience and reservoir simulation study
- Detailed pilot scale geoscience and reservoir simulation study
- Site selection for pilot plant and CO2 injection well
- Pilot program plan development, including a Measurement, Monitoring and Verification (MMV) plan
- 3D baseline seismic program over the pilot area
- Produce information to support regulatory discussions on shallow reservoir CO2 sequestration potential in the oilsands region

BENEFITS TO ALBERTA

- Development of technology that allows Alberta’s oilsands industry to thrive in a low carbon economy
- Inform regulatory personnel about the potential for shallow reservoir CO2 sequestration
- Enable commercial-scale, cost-effective sequestration of CO2 in the oilsands region
- Creation of new jobs to deploy the technology at commercial scale across the oilsands sector
- Increase the opportunity for investment in Alberta’s oilsands industry
- Be recognized as a global leader in CCS solutions and a provider of clean, low carbon energy products
